## RF exposure evaluation

The RF exposure evaluation was calculated as below:

- 1) The maximum output power for antenna is -3.787dBm (0.418mW) at 2480MHz of O-QPSK mode.
- 2) For Zigbee device or fixed location transmitters, no SAR consideration applied.
- 3) Per KDB 447498 D01v05r02, the 1-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]  $\cdot$  [ $\sqrt{f(GHz)}$ ]  $\leq 3.0$  for 1-g SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- · Power and distance are rounded to the nearest mW and mm before calculation
- When the minimum test separation distance is < 5 mm, a distance of 5 mm according is applied to determine SAR test exclusion.
- The result is rounded to one decimal place for comparison

Channel	Frequency (GHz)	Power (dBm)	Max. Power (mW)	Test distance (mm)	Result	exclusion thresholds for 1-g SAR
CH16	2.480	-3.799	0.418	5	0.132	3.0

- · Base on the calculation value, the RF exposure evaluation is not required.
- The public is not exposed to radio frequency energy level in excess of the Commission's guideline.
